

# Shafts

During our 60 year old history we developed a very strong know-how, which allows us to produce shafts of high quality, gears and other high quality components for the needs of the car industry, electrical hand tools and other segments of the industry. We achieved that with our own knowledge, development and constant checking of the market.

We are controlling a large spectre of technologies with a modern and equipped engine park and expert and dedicated staff.

Our key technologies are turning, milling, gear cutting, rolling, grinding and heat treatment.

# We have the vision. We know the way.

We believe that the final products – whether it is a car, a pump, a burner or a professional boring machine – can be exceptional only if its vital parts are technologically complete. That is the reason we supervise each shaft with modern measuring equipment. Beside the statistical control of the process (SCP), we include other standards processes of measure:

- measure of hardness,
- control of indentations,
- and other standard procedures for guaranteeing quality.
